

SolutionBuilder – Mini HOWTO

Create project paths

Create following paths where you would like to have your project:

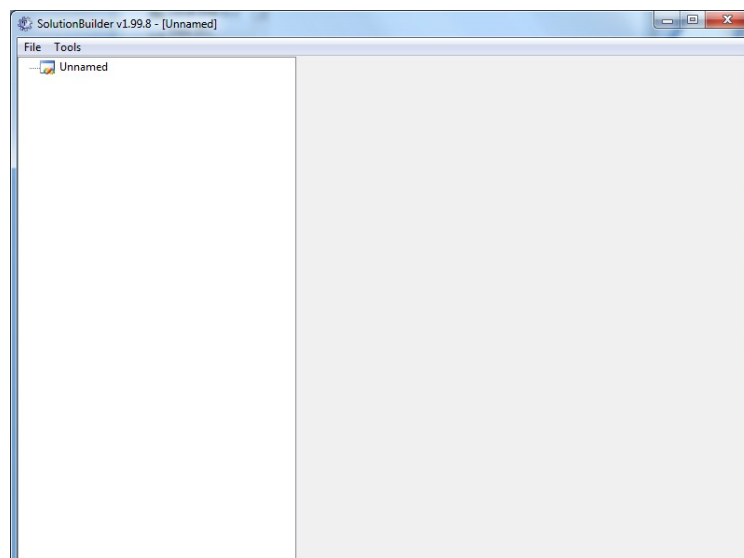

mytestapp/

mytestapp/code/

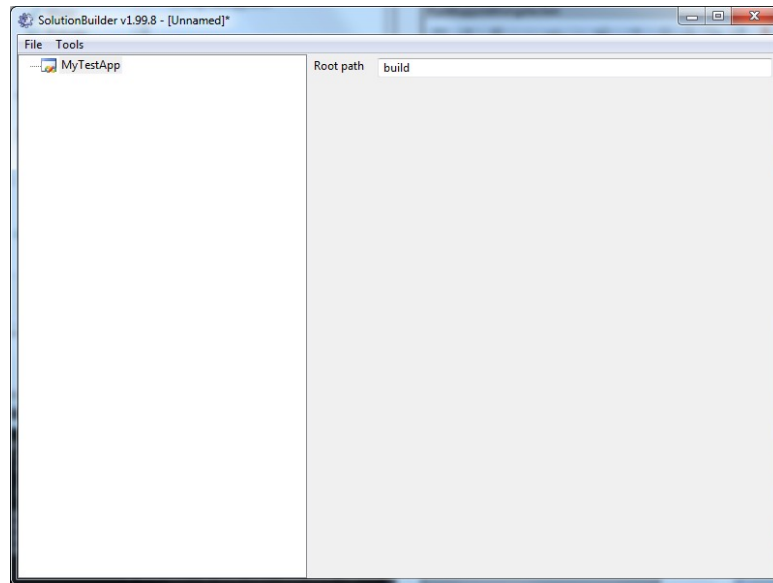

mytestapp/code/TestApp

Create solution file

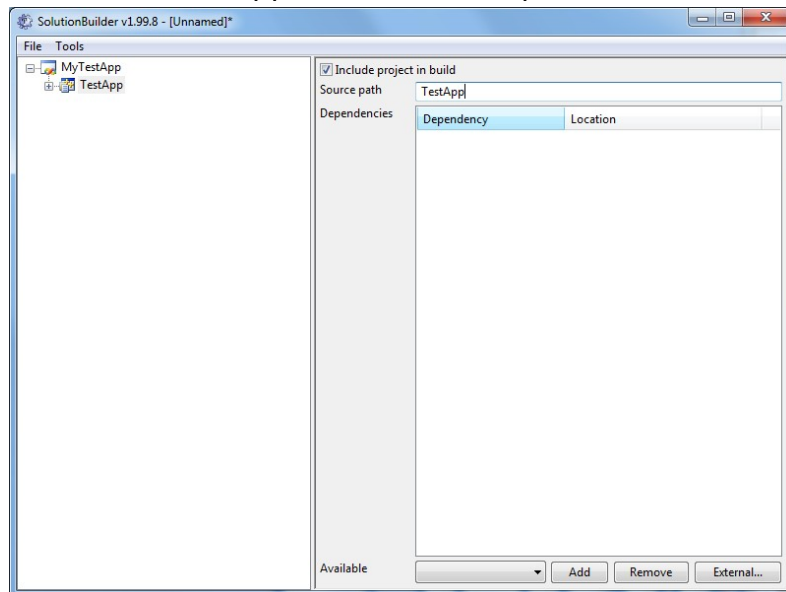

Start *SolutionBuilderUI* (<Your traktor path>/bin/SolutionBuilderUI.exe)

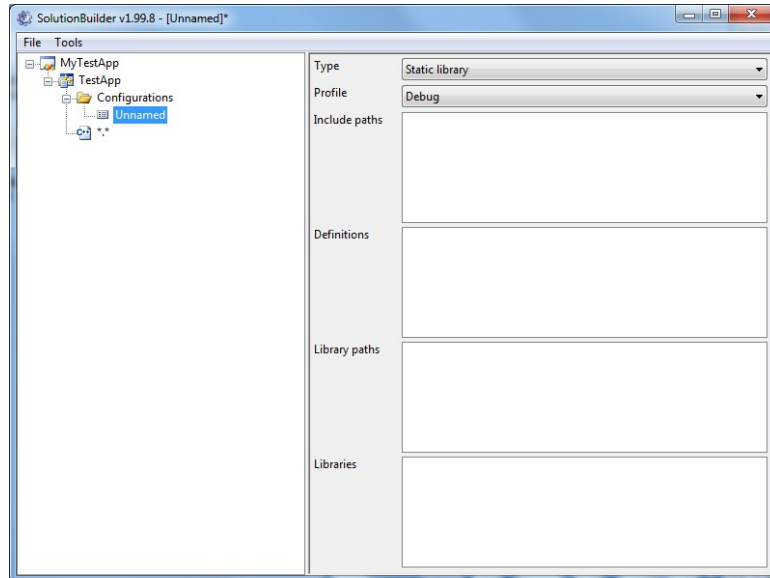

1. Rename "Unnamed" solution to "MyTestApp" by double-click on tree node.
2. Select *MyTestApp* node and enter Root path as "build"

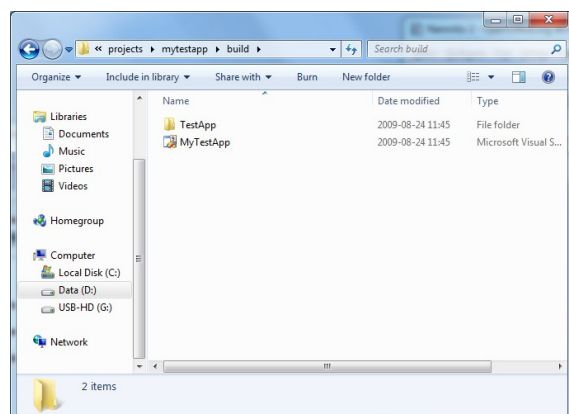

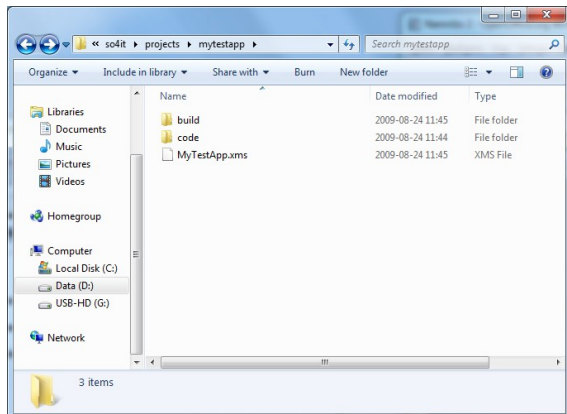

3. Right click on *MyTestApp* node and select **Add New Project**, rename project to "TestApp". Also enter "TestApp" as the source path.

4. Right click on *TestApp* node and select **Add New File**, a default "*.*)" wildcard file is added but this can be changed when necessary.
5. Again right click on *TestApp* but this time select **Add New Configuration**.

6. Rename configuration from "Unnamed" to "Release", change type to **Executable (Console)** and profile to **Release**.
7. Save solution as "MyTestApp.xml" in the project path.
8. In order to generate Visual Studio 2008 solution run following command
SolutionBuilder -f=msvc -p=<Your traktor path>\bin\msvc-2008-win32.xml MyTestApp.xml

9. Open your Visual Studio solution as always.
